GAME OF CODES | ANAZORI v16.0

Full Stack & Generative AI Hackathon

Organised by: Centre for Computer Science and Applications (CCSA), Dibrugarh University
Date: 4th November, 2026
Theme: Building Intelligent, Inclusive and Bilingual Digital Solutions

PS-01: CampusIQ - Bilingual AI-Powered Smart University Assistant

Problem Statement

Design and develop a full-stack Generative AI-powered university assistance platform that enables students, faculty members, and administrative staff to access academic and institutional information through natural-language interactions in both Assamese and English.

The system should answer queries related to university regulations, examinations, academic programmes, scholarships, admission procedures, and campus facilities.

Expected functionalities:

- Interactive bilingual chatbot accepting queries in Assamese and English.
- Upload and management of university documents, notices, and academic regulations.
- AI-generated answers grounded in institutional documents, with appropriate source references.
- Language switching between Assamese and English.
- Student and administrator interfaces with query history.

Gen AI challenge: Bilingual Retrieval-Augmented Generation (RAG), Assamese-language query understanding, multilingual semantic search, and hallucination reduction.

PS-02: SkillBridge - Bilingual AI Career and Placement Navigator

Problem Statement

Develop an intelligent full-stack career guidance and placement assistance platform that helps university students evaluate their skills, identify suitable career opportunities, and receive personalised recommendations in Assamese and English.

The platform should make career guidance accessible to students who prefer communicating in their regional language.

Expected functionalities:

- Bilingual student registration and profile management.
- Resume upload and AI-assisted skill extraction.
- AI-generated career recommendations and skill-gap analysis.

- Personalised learning roadmaps in Assamese or English.
- Interactive bilingual career counselling assistant.
- Placement readiness dashboard.

Gen AI challenge: Resume analysis, semantic skill matching, personalised career guidance, and generation of meaningful career recommendations in Assamese and English.

PS-03: LearnMate - Bilingual Generative AI Personalised Learning Platform

Problem Statement

Build an intelligent full-stack educational platform that transforms uploaded academic materials into personalised learning resources, explanations, quizzes, and assessments in Assamese and English.

The system should support students who wish to understand complex academic concepts through explanations in their preferred language.

Expected functionalities:

- Teacher and student registration with role-based access.
- Upload of lecture notes, PDFs, and study materials.
- AI-generated explanations and summaries in Assamese and English.
- Automatic generation of quizzes and practice questions.
- Bilingual question-answering based on uploaded materials.
- Student performance tracking and personalised revision recommendations.

Gen AI challenge: Bilingual educational content generation, cross-lingual document understanding, automatic question generation, and personalised feedback.

PS-04: CivicSense - Bilingual AI Smart Campus Issue Management System

Problem Statement

Develop an AI-enabled full-stack grievance and campus issue management platform that allows students, employees, and other university stakeholders to report and track campus-related problems in Assamese or English.

The system should intelligently interpret complaints, categorise issues, identify duplicate reports, and assist administrators in coordinating appropriate responses.

Expected functionalities:

- Submission of complaints in Assamese and English.
- Image-based and text-based complaint reporting.

- AI-driven complaint classification and prioritisation.
- Automatic bilingual complaint summaries.
- Complaint status tracking and notifications.
- Administrative dashboard with issue statistics and resolution management.

Gen AI challenge: Assamese-English complaint understanding, multimodal information extraction, semantic duplicate detection, and bilingual summarisation.

Mandatory Technical Requirements

The following requirements shall apply uniformly to all participating teams, irrespective of the selected problem statement.

Component	Minimum requirement
Frontend	Functional, responsive web application
Backend	Working server-side application with APIs
Database	Persistent storage for application data
Generative AI	Meaningful integration of an LLM or other generative model
Language support	Mandatory Assamese and English
Input	Accept Assamese and English text for core AI functionality
Output	Generate meaningful responses in Assamese and English
Language switching	Allow users to select their preferred language
Demonstration	Working end-to-end demonstration in both languages

Special Assamese Language Requirement

All teams must ensure that:

1. Assamese is a functional language, not merely a translated interface. Core AI features must process Assamese-language input and generate Assamese-language output.
2. The application supports Assamese Unicode text correctly, including rendering, input handling, and storage.
3. Users can perform at least one complete application workflow independently in Assamese and in English.
4. AI-generated Assamese content is reasonably accurate, contextually relevant, and understandable.

5. Teams demonstrate at least three meaningful test scenarios in Assamese and three in English, including at least one that tests language-specific behaviour.

Teams may use multilingual language models, translation APIs, Assamese NLP resources, or other suitable approaches. Training a new language model is not mandatory.

Proposed Evaluation Criteria

Full Stack Implementation: 20 marks

Frontend, backend, database and integration Generative AI Integration: **25 marks**

Appropriate AI features, accuracy and reliability Assamese-English Language Capability: **20 marks**

Bilingual input, output, usability and linguistic quality Innovation and Practical Relevance :**15** marks

Originality, usefulness and local impactFunctionality and User Experience: **15 marks**

Working application and accessible interface Presentation and Demonstration: **5 marks**
Clarity and live demonstration

Total 100 marks

NOTE: This is a purely software-based hackathon. Teams are expected to develop and demonstrate a software solution, such as a web application or a mobile/desktop application. Evaluation will focus on the software solution, including its functionality, technical implementation, usability, innovation, and practical impact.
